

eqFocus

EARTHQUAKE LOCATION & MAGNITUDE CALCULATION SOFTWARE

FEATURES

- Simple user interface
- Portability
 - standalone operation or
 - Network to shared SQL earthquake database
- Visualise locations using the in-built World Wind earth browser
- Export data to ISC and SeisAn
- Database information management in eqFocus
- Runs on any platform supporting Java Runtime Environment (JRE), eg Windows, Mac OSX, Unix

APPLICATIONS

- Local and regional earthquake monitoring
- Micro-seismic and aftershock monitoring

SOFTWARE

seismic solutions

eqFocus is an interactive earthquake location and magnitude calculation program designed with ease of operation in mind. Seismograph trigger information can be entered manually, read from files, or extracted from a database.

Custom earth models can be added and users can quickly swap between models. Seismic stations and Place names can be easily added to the database from within eqFocus without the need to edit the database using text commands or other tools.

TECHNICAL SPECIFICATIONS

Inputs

- eqWave data files with embedded arrivals, peak, amplitudes and frequencies
- Existing locations and arrivals in the database, including automatic locations created by eqWatch
- SeisAn and EQLOCL format earthquake location files
- Manually entered arrivals, peak amplitudes and frequencies

Magnitude Calculation

- Calculates Richter local & duration magnitudes using response information & user defined functions

Output

- Stores location information into a database
- May produce a SeisAn format file containing trigger and location information

Display

- Easy to edit list of arrivals and magnitudes
- A map showing location of the event, seismographs and nearby towns

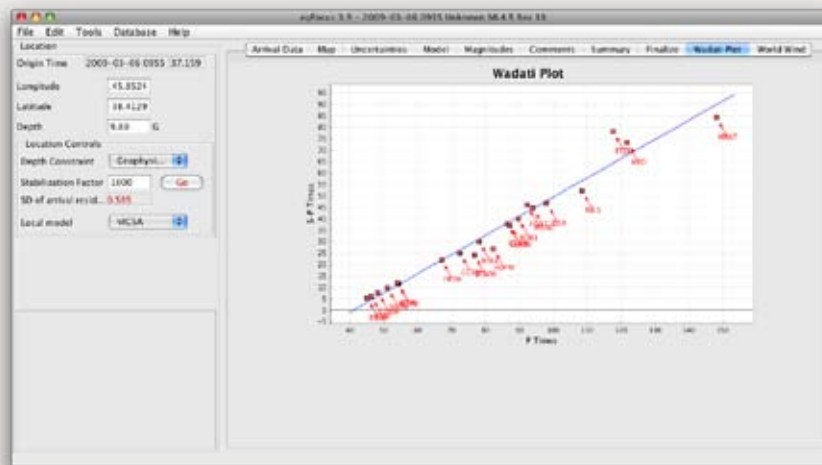

Requirements

- Computer with Java Runtime Environment
- Compatible with Windows, Mac OS X, Unix, Linux and other operating systems
